

- null on prespecified test
- significant association
- development estimate (hypothesis-generating)

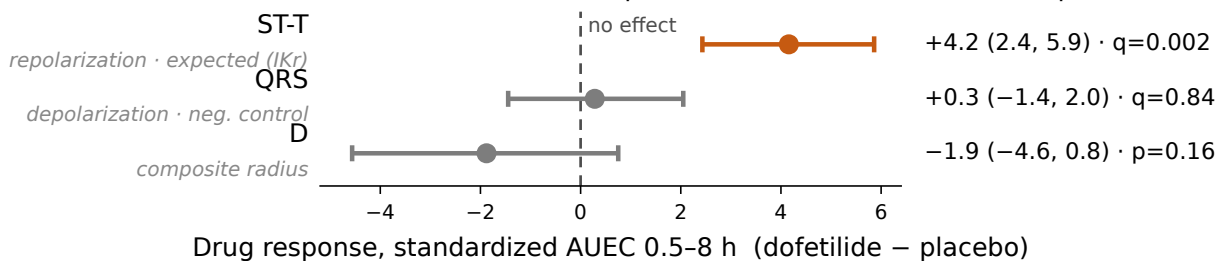

The confirmatory mortality test is null for the composite radius D;
the organ-system arm behaves differently

The composite radius D does not shift under acute ischemia

Dofetilide (IKr block) displaces the ST-T clock, not the composite radius

On the CODE-15 final split, AV and ST-T phase-age gaps carry the
mortality association (secondary; not confirmed by the external test)
